Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is used in a method which involves the production of CC catalytic DNA molecules which can be used for cleaving target nucleic cc acid molecules. Such DNA molecules can be used in pharmaceutical and CC medical products (e.g. for wound debridement, clot dissolution), as well cas in household items (e.g. detergents, dental hygiene products, meat CC tenderisers'). Other suitable substrates include those comprising or CC produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), CC lymphocryptoviruses (e.g. HPV), gammaherpesvirinae (e.g. EBV), CC lymphocryptoviruses, leukemia viruses (e.g. HTLV-1 and -11), Influenza viruses, CC viruses and retroviruses contributing to immunodeficiency diseases and covine leukemia viruses. They can also be used as regulators of gene expression.
                                                                      Identifying sites on a target or in vitro-synthesized RNA accessible antisense, ribozyme, or DNAzyme binding comprises incubating hybridizing the target RNA with an antisense oligodeoxynucleotides,

Any antisense oligonucleotide, ribozyme or DNAzym which is complementary to an accessible site in the target sequence hybridises to that site and the sequence is cleaved. The cleavage products can then be detected to identify the accessible binding sit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNAzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (CITY ) CITY OF HOPE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       e present invention relates to a method for identifying sites on a rget RNA which are accessible to pairing by antisense DNA, ribozymes cazymes. The present sequence is a DNAzyme catalytic core sequence. The method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is a property of the method of the present invention the target sequence is a property of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated the method of the present invention the target sequence is incubated to the present invention the present invention the target sequence is incubated to the present invention the present invention the present invention the target sequence is incubated to the present invention the

(Ī) is useful in diagnostic applications to identify the presence of genss and/or gene products indicative of a particular genotype and/or phenotype, e.g. a disease state or infection and for diagnosis of disease states or physiological abnormalities related to the expression of viral, bacterial or cellular RNA and DNA. (I) is useful in nucleic acid-based electronics, for the detection of specific target signalling molecules, in assays to assess the specificity, toxicity and effectiveness of various small molecules, nucleoside analogues or non-nucleic acid drugs or for detection of pathogens, biochemicals, organic or inorganic compounds. The present sequence is that of a DNAzyme motif of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid sensor molecule useful in diagnostic applications, nucleic acid-based electronics and functional genomics, comprises a enzymatic nucleic acid and one or more sensors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid sensor molecule; detection; infection; disease physiological abnormality; electronic; signalling molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABA02749;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           03-FEB-2000; 2000US-0179983

CC expression of a CD20 gene and a nucleic acid molecule which down regulates CC expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NOGO).

CC possessing an CP motif), a G-cleaver (cleaving an RNA molecule cold cleaving an RNA molecule cold cleaving RNA with a NYN molecule cold cleaving RNA with a NYN molecule cold cleaving RNA with a CD20 in the presence of a divalent cation that is cleaving RNA with a CD20 in the presence of a divalent cation that is cleaver cleaving RNA with a cell to reduce cc cold activity of the cell and treat a patient having a condition cassociated with the level of CD20. The treatment may further comprise the cc cassociated with the level of CD20. The treatment may further comprise the cc cassociated with the level of CD20. The treatment may further comprise the cc cassociated with the level of CD20. The treatment may further comprise the cc cassociated with a sesociated NHL, lymphona, leukaemia, HIV (human clow-grade or follicular NHL, lymphocytic leukaemia, HIV (human clow-grade or follicular non-Hodgkin's lymphona (NHL), can immune comprise the cc immunocytoma (IMC), small B-cell lymphocytic lymphoma (NHL), immune comprise concepts a sesociated NHL, mantle-cell lymphoma (NHL), concepts a patient cation that is preferably My^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and creatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one

                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                   The invention relates to enzymatic nucleic acid molecules that down CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic constructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic cfibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or crissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition comparises the use of one or more therapies under conditions suitable for the creatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The cucleic acids of the invention are also used as diagnostic tools to cexamine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an creative of the invention are also used as captance represents and concleic acid molecule of the invention.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Webersyndrome

Disclosure; Figure 5; 149pp; English.

CC expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cc neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge cweber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies cunder conditions suitable for the treatment. Leukaemia or tumour canjuogenesis is treated by administering (I) to the patient in cc conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a ccell, by contacting the cell with (I). (I) is useful for cleaving RNA of Ccell, by contacting the cell with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABX17354-ABX2719 represent nucleic acids, including antisense and cargeting nucleic acid molecules which regulate expression of ERG, and cargeting antisense and the invention.

      cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg'2'+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, datrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                              Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatrexate; gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;
                                                                                                                                                                                                                                                                                                                   The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cannot and in the configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          នន្តន្តន្តន្ត
The present sequence is an example of a DNAzyme, an enzymatic CC nuclear acid (ENA) that does not require the presence of a 2'-OH CC group for its activity. DNAzymes can be used as the ENA moiety in CC novel ENA peptide conjugates (I) of the invention that facilitate CC delivery of molecules into biological systems, such as cells. The peptide part of the conjugate is typically a fusogenic peptide such cC used to treat a cancer patient, where the cancer is breast, lung, CC colorectal, brain, oesophageal, stomach, bladder, pancreas, curvix, head and neck or ovary cancer, melanoma, lymphoma, glioma or CC the virus is HIV, hepatitis B virus, hepatitis C virus, cc the virus is HIV, hepatitis B virus, hepatitis C virus, cous sarcoma virus, hepatitis C virus, foot and mouth disease virus or papilloma virus, Ebola virus, foot and mouth disease virus or papilloma virus, incleosides, nucleic acid molecules, lipids, peptides, proteins and/or non-nucleosidic small molecules, linto a cell and to detect the presence of a target molecule in a biological system such as cc tissue, cell or cell lysate. They are useful as diagnostic tools to examine genetic drift and mutations within diseased cells or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                     The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519,

                                                                                                                                                                                                                                                                                                            acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-luman immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ66529, ABZ66529, ABZ66528 - ABZ66528 - ABZ66529, ABZ66528 - ABZ66529, ABZ66528 - ABZ66528 - ABZ66529, ABZ66529, ABZ66528 - ABZ66528 represent human ribozymes of

The method is specifically cx (ii) may be performed concurrently with (i). The method is specifically cx syndrome and cystic fibrosis. (I) recognises as few as two by to create cx syndrome and cystic fibrosis. (I) recognises as few as two by to create cx cleavage site (contrast at least 4 by required by enzymes used in cx cleavage site (contrast at least 4 by required by enzymes used in cx cleavage site of contrast at least 4 by required anylysis; such sites cx primers can be used to induce cleavage sites for (I). The method is contentially more flexible than RELP and does not require any enzymes or cx contentially more flexible than RELP and does not require any enzymes cx cx equences used in the exemplification of the present invention.

The present invention describes a method for determining whether a CC subject is afflicted with a disorder characterised by the presence of cx a known nucleic acid. The method comprises: (1) amplifying, in an CC isolated sample from the subject, the nucleic acid segment that, in an CC affected individual contains (A), (ii) treating the amplicons with a CC catalytic nucleic acid (I) that specifically recognizes and cleaves a CC catalytic nucleic acid (I) that specifically recognizes and cleaves a CC catalytic nucleic acid (I) that specifically recognizes and cleaves a CC contain the segment in either the mutated or wild-type segments, the nucleic acid segment in the precision of the method is specifically (I) may be performed concurrently with (i). The method is specifically CC used to diagnose cancer (especially), acquired immune deficiency CC syndrome and cystic fibrosis. (I) recognises as few as two bp to create a cleavage site (contrast at least 4 bp required by enzymes used in CC restriction fragment length polymorphism (RFLP) analysis); such sites ccur more fragment length polymorphism (RFLP) analysis); such sites ccur more fragment length polymorphism (RFLP) analysis); such sites cour more fragment length polymorphism (RFLP) analysis); such sites cour more fragment length polymorphism (RFLP) analysis); such sites cour more fragment length polymorphism (RFLP) analysis); such sites cour compounds. ANZ34339 to ANZ34450 represent oligonucleotide course used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-OCT-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting diseases associated with a known mutation by amplification and cleavage with catalytic nucleic acids, particularly for cancer, human immune deficiency virus and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO9950452-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC quantitative real-time determination for the amplification and CC quantitative real-time determination function acid (I) using a primer CC attached to a 1-40 nucleotide sequence (II) in the transcription product. CC Amplification is done in the presence of an excess, preferably 50-500 nM, CC of a nucleicated probe (III) and labeled by a reporter molecule and a CC quencher molecule. (I) encodes the motif 5'-GAAA-3' (A), and (II) CC contains the motif 5'-GUGANCA-3' (B). (III) has 25-60, especially 50, CC quantification of (I), particularly RNA by NASBA (RTM) (nucleic acid contains the method allows real-time detection and CC quantification of (I), particularly RNA by NASBA (RTM) (nucleic acid esquence-based amplification), without the difficulties associated with CC use of DNA probes (see Nucleic Acid Res., 26 (1998) 2150) and is suitable CC for routine use. Specifically the combination of (A) and (B) generates a CC hammerhead ribozyme that cleaves the probe and generates a fluorescent CC signal. Since many probes are cleaved, a high signal is produced, CC resulting in high sensitivity and shorter reaction times. The method is correctly specific since exact hybridization of probe to target is necessary CC for routine usits of dissociation of the probe from the target (which CC cleavage results in dissociation of the probe from the target (which CC consisting mainly of 2'-deoxyribonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ65217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66528 - ABZ66528 represent human ribozymes of the
                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                              Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;
enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV;
anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic acitivity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ662217 - ABZ64543, ABZ65532 - ABZ66529, ABZ66586 - ABZ66658 represent human ribozymes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                           The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acidity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABZ66649;
                                                                                                                                                                                                                    The invention relates to a novel short interfering RNA (siRNA) nuclei acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-mundeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66538 represent human ribozymes of ABZ66535 - ABZ66529, ABZ66538 - ABZ66538 represent human ribozymes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, h-Ras, h-Ras, numan immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ665217 - ABZ66532 - ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66528 - ABZ66558 represent human ribozymes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66529, ABZ66528 - ABZ66529, ABZ66529, ABZ66528 - ABZ66529, ABZ66529, ABZ66529 - ABZ66529, ABZ66529 - ABZ66529, ABZ66529 - ABZ66529, ABZ66529, ABZ66529 - ABZ66529, ABZ6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering RNA (sirNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ65217 - ABZ66533 - ABZ65519, ABZ66525 - ABZ66529, ABZ66528 - ABZ66528 represent human ribozymes of timeserics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519,
